softwareQ: Finding variable name from variable in python I am using Python 3.3, and I
have been having trouble making variable changes. For example: `user = raw_input()
name = 'name' if user == name: print('Your name is:'+ user) else: print('Sorry, I do not
know that name')` The above code will work, but if I change it to: `user = raw_input()
name = 'name' if user == user: print('Your name is:'+ user) else: print('Sorry, I do not
know that name')` It gives an error: `if user == user: SyntaxError: can't assign to literal` In
this case, I am simply trying to check if 'user' equals itself (to check if a command typed
by the user is equal to the user's name). I have also tried using `**`, with no luck. I don't
really care about solving the problem, just how to get around the error. Also, I am aware
that it might not be possible to do this, but I would like to know anyway. A: It isn't
allowed to assign to a variable name. As explained in the docs, a variable's value must be
an object, not a variable name. You can either set `name` to the value of the variable: `user
= raw_input() name = 'name' if user == name: print('Your name is:'+ user) else:
print('Sorry, I do not know that name')` or use string concatenation: `user = raw_input()
name = 'name' print('Your name is:'+ user)` The first version is preferred, but you should
be aware that `name` is a builtin function and it's not guaranteed to be available in all
versions of Python. This invention relates to a process for preparing
