But I'm getting black screens on the monitor at start-up. So I'm forced to restart my PC and then it boots to the desktop but the resolution is quite bad. Is it possible that the power settings are somehow wrong? I have a PC with NVIDIA GeForce GTX560 and I usually just turn off the monitor when I go to sleep. But I'm getting black screens on the monitor at start-up. So I'm forced to restart my PC and then it boots to the desktop but the resolution is quite bad. Is it possible that the power settings are somehow wrong? Power Settings Are Unstable - Bad Power Supply? I have the same problem. I know that there is a power supply on my motherboard. The fan works fine and there is no power noise from the power supply. Power switching is fine as well. What could be the problem? If you have the wrong power supply then it could be a boot error. Make sure you have a bootable windows disk and that it will boot from it. Or perhaps you don't have the right graphics card installed. I thought you were going to remove it but the battery was charging so I didn't need to. Although the DC connector for the battery is gone from the device now. This has not been damaged (other than the booting of the laptop) as I removed the power supply immediately after and the laptop booted fine. I then left it for about 3 weeks before returning to it today so it has not been exposed to any power surges. That is strange, I had that problem a few times already. When the battery was empty, the laptop would switch off, but there was no display output. After replacing the battery, it would start up, but the laptop screen would have been displaying a blank screen. Removing the power supply, turned the power back on and the laptop would start up normally, but
