Chronic Pain Patients. By Tessa J. Wright, MD. Despite the ongoing debate on the over-prescribing of opioids in the United States, a growing number of recent studies have reported that psychological factors are positively associated with persistence on chronic opioid therapy. There have also been contradictory findings from prior studies regarding the associations between perceived stress and opioid use. This updated review highlights a growing body of evidence that has found stress to be positively associated with the initiation, continuation, or escalation of opioid therapy among individuals with chronic pain. There is also considerable evidence to support a positive correlation between stress and the occurrence of opioid-related side effects. This article will critically evaluate current studies regarding the associations between perceived stress and opioid therapy in chronic pain. This review will also highlight the importance of considering psychological and emotional symptoms of pain patients when prescribing opioid therapy.

**Background** Although opioids are an effective treatment for some patients with chronic pain, they are also frequently associated with adverse effects, including sedation, addiction, abuse, and overdose. Of note, psychological factors have been shown to predict persistence on opioid therapy, and psychological
