CPanel Wizard

----- Do you use cPanel to manage your web host account? Do you have hundreds of cPanel accounts, each with dozens of subaccounts? Do you have a few cPanel accounts that you manage, but then forget about them until they fall behind? Do you have several dozen cPanel accounts that you use to store various items, and then forget about them until you find that you can't access them at all? Do you use cPanel to store passwords, and then end up forgetting the first account to access your password, because of the sheer number of accounts you have set up? When all else fails with cPanel, you go into the closet and ask your spouse how to access your website... or use a website like this one. cPanel Wizard is a tool designed to help you manage your cPanel accounts and automate your future access to them. cPanel Wizard is a one-click access to your cPanel database of all of your accounts, including several subaccounts, several sub-sub-accounts, and dozens of sub-sub-sub-accounts (or even hundreds of sub-sub-sub-accounts). cPanel Wizard also comes with a few bonus features to make things easier: * Your cPanel usernames and passwords are stored securely in a protected configuration file. * cPanel Wizard automatically generates your cPanel password if you forget it. * cPanel Wizard automates and configures the software used to access the cPanel accounts on your site. * cPanel Wizard is smart. It will give you a one-click access to your cPanel account if it was previously inaccessible (due to a change in your password, an expired session, or even an accidental shutdown of your server). Using cPanel Wizard ----- You can access the cPanel Wizard by selecting it from the cPanel Home screen (When you click the 'Access the cPanel Wizard' button, cPanel Wizard opens and immediately displays your cPanel database of all of your accounts, including several subaccounts, several sub-sub-accounts, and dozens of sub-sub-sub-accounts. cPanel Wizard is smart - it will go into your account, if it knows the username and password are set correctly, and display a screen to take you directly to that account. You can also use cPanel Wizard to login, and change your password

What's New In CPanel Wizard?

A: For those who are looking for a wizard or auto-installer in PHP and Apache, here is one. A: The ideal way to install hosting services, or any website really, would be to develop a script using something like PHP, as it's a programming language and can perform all necessary steps for a server installation. A good host like cPanel should have a guide on how to do this, but if you need to look for this information, then The PHP Hosting Script is a good place to look. Q: How to make a single query get a list of connected users I have 3 tables in my database and 3 queries to connect them. The queries are: Table 1: user-Table => table userid, name Table 2: userfriend-Table => id, userid1,userid2 Table 3: actUser-Table => actid, userid, actuserid A user is connected to another user with actuserid. How do I make a

single query that can give me a list of connected users and their id? Table1: id |name ----- 1
|Mike 2 |Tom Table2: id |userid1 |userid2 ----- 1 |1 |2 2 |2 |1 Table3: id |userid
|actuserid ----- 1 |1 |1 2 |1 |
